

Insurance Company

Client Role: We are an insurance company operating across Europe (or the region of interest). Our products include income protection, property insurance, and business interruption coverage. We need to monitor how economic conditions are perceived in each of these given markets, not only using statistics, but how the media frames them. This is because media-driven narrative can directly affect the business i.e. claim volumes increase when consumers feel the economy is bad, and policy sales drop when media sentiment is fearful. We want a knowledge graph-based solution to compare media economic sentiment against real economic indicators so we can predict surges in claims and adjust pricing (or any other parameter) proactively.

Research Questions

1. How does the volume and sentiment of media coverage on inflation, housing, and employment differ between countries (say NL, DE, FR, and UK) over the past 2 or 3 years, and which economic topic dominates each country's media narrative?
2. Till what extent does media sentiment on economic topics lead/lag actual economic indicators (inflation rate, unemployment rate, house price index) in each country. Does negative media coverage predict degrading economic conditions, or does it hardly reflect the truth?
3. Which entities like (national central banks, government ministers, employer organizations etc.) are more associated with each economic topic per country, and how does the tone surrounding these actors differ across markets?

Data Sources

1. **GDELT Global Knowledge Graph (GKG):** Open dataset that monitors news from over 189,000 sources worldwide in 100+ languages, updated every 15 minutes.

<https://www.gdeltproject.org/>

2. **Eurostat - Harmonised Index of Consumer Prices (HICP):** Monthly inflation rates per EU country, broken down by product category (food, energy, housing, services). This provides the ground-truth inflation figures against which we compare media sentiment

<https://ec.europa.eu/eurostat/web/hicp/database>

3. **Eurostat - Unemployment Statistics & House Price Index:** Country-level monthly unemployment rates and quarterly house price indices for the required countries. Together with the HICP data, these cover all three economic topics in our research questions (inflation, employment, housing)
